AegisLead

FIND LEADS. | ENGAGE. | CONVERT. | GROW.

COMPLETE PLATFORM OVERVIEW

Everything **AegisLead** does, in one document.

The operating system for a physical security company — lead generation, guard tour and patrol verification, scheduling, timesheets, invoicing, client and vendor portals, and an AI layer across all of it.

DOCUMENT	PREPARED FOR	VERSION
Functional Overview	Explainer video production	11 November 2026

This document describes the platform as it exists in the production build on 11-11-2026. Every feature listed here is implemented and shipped. Where something is partially built or deliberately out of scope, it is marked as such rather than omitted.

Contents

1	What AegisLead Is	The problem, the solution, who uses it
2	The Four Experiences	Admin app, guard app, client portal, vendor portal
3	How It Is Packaged & Priced	Three products, four packages, guard-band pricing
4	AegisLead Generation	Leads, deals, prospect research, calls, proposals, RFP, vendors
5	AegisLead Guard	Sites, guards, QR patrols, incidents, emergencies, reports
6	The Guard Mobile Experience	Check in, patrol, report, check out — from the phone
7	AegisLead Operations	Shifts, timesheets, rate cards, invoices, disputes, finance
8	The Client Portal	What your customer sees and signs off
9	The Vendor Portal & Procurement	Subcontractor bidding, AI evaluation, award
10	The AI Layer	Every AI feature and what it costs to run
11	Users, Roles & Account Security	Eight roles, 2FA, session control, audit trail
12	Integrations & Open API	Eight CRMs, CSV import, webhooks, public API
13	Billing, Credits & Self-Service	Stripe checkout, credit packs, auto top-up
14	The Platform Admin Console	How AegisLead itself runs its customers
15	Architecture, Security & Reliability	How it is built, hosted, protected and backed up
16	What Changed in the Last Two Months	September–November 2026 release highlights
17	Suggested Video Walkthrough	A shot-by-shot running order for the explainer
18	Known Limits & Roadmap	What is deliberately not built yet

> **How to read this document.** Sections 4, 5 and 7 map one-to-one onto the three products a customer can buy. Sections 6, 8 and 9 cover the three audiences outside the office — guards, clients and subcontractors. If you are scripting a video, section 17 turns all of it into a running order.

01 What AegisLead Is

POSITIONING

AegisLead is a single platform that runs a physical security guarding company end to end — from winning the contract, to putting guards on site and proving they were there, to getting the invoice paid.

The problem it solves

A typical guarding company runs on four or five disconnected systems: a CRM for sales, a scheduling tool for rosters, a separate guard-tour app with its own hardware, an accounting package for invoices, and a large quantity of spreadsheets and WhatsApp groups holding it all together. Nothing talks to anything else. Hours are re-keyed from a patrol app into a timesheet and again into an invoice. When a client asks "was your guard actually at the loading bay at 2am?", the answer takes someone half a day to assemble.

AegisLead replaces that stack with one system where the data only gets entered once and then flows: **a lead becomes a client, a client gets sites, sites get shifts, shifts get guards, guards produce verified patrol evidence and attendance, attendance becomes an approved timesheet, and the timesheet becomes the invoice.**

01
Win the work
Find the prospect, research it, call, propose, close.

›

02
Staff the work
Set up the site, roster guards onto shifts.

›

03
Prove the work
QR and GPS-verified patrols, incidents, daily reports.

›

04
Bill the work
Attendance to timesheet to invoice to payment.

What makes it different

One record, four uses

A guard's check-in is simultaneously an attendance record, a shift status change, a line on the client's daily report, and the basis for a billable timesheet line. It is entered once, by the guard, on their phone.

Evidence, not assertions

Patrol checkpoints are verified two independent ways — a scanned QR code fixed to the physical checkpoint, and a GPS geofence. Both results are stored separately, so a dispute is settled with data rather than memory.

The client is inside the system

Customers get their own login to approve proposals, read approved incident reports, download daily service reports, see invoices and raise disputes — instead of being emailed PDFs.

AI where it removes real work

Not a chatbot bolted on. AI drafts the proposal, researches the prospect, transcribes and coaches the sales call, writes the daily report summary, scores the lead, evaluates subcontractor bids and recommends which guard to put on an open shift.

Who it is for

Security contractors running anywhere from a handful of guards to several hundred. The platform is multi-tenant: every company's data is completely separate, and the product is sold in three parts so a company that only wants the sales engine, or only wants guard tour, can buy exactly that.

4	3	8	70+	24
USER EXPERIENCES	SELLABLE PRODUCTS	BUILT-IN ROLES	FEATURE MODULES	AI CAPABILITIES

02 The Four Experiences

WHO LOGS IN WHERE

One platform, four distinct front doors. Each audience sees only what belongs to them, and three of the four never see the main application at all.

Experience	Who uses it	What they do there
Admin application	Owners, managers, schedulers, supervisors, finance and sales staff	The full product. Sales pipeline, site and guard setup, rostering, patrol configuration and monitoring, incident review, timesheets, invoicing, procurement, integrations, billing and user administration — each person seeing only the pages their role allows.
Guard portal	Field guards, on their own phone	A mobile-first app: today's shifts, check in and out, walk a patrol route scanning QR checkpoints, file an incident with photo or video evidence, and raise a panic alert.
Client portal	The security company's own paying customers	Review and approve or reject proposals with comments, read approved incident reports, download published daily service reports, view and dispute invoices, download shared documents and see their insurance status.
Vendor portal	Subcontracted security vendors invited to bid	A single-use secure link — no account, no password. The vendor sees exactly the one RFP they were invited to and submits a priced bid with supporting documents.

Why this matters on camera

The strongest demonstration of the product is the hand-off between these four surfaces: a proposal drafted by AI in the admin app, approved by the client in the client portal, a shift created from it, a guard checking in on a phone, and the resulting invoice appearing back in the client portal. That single chain is the whole value proposition.

Separation and isolation

Each experience authenticates separately and carries its own token type. A guard's credentials cannot open the admin application; a client's cannot see another client's invoices; and every query the system runs is scoped to the tenant that owns the data. A second layer, **branch scoping**, further restricts staff to their own regional office where a company is organised that way.

The platform console — a fifth, internal surface

Separate from all of the above, AegisLead itself operates a **Platform Admin console** used only by the AegisLead team to see customer accounts, trials, AI spend and credit balances. It is a fully separate identity with its own credentials — a customer administrator, however senior, has no path into it. Covered in section 14.

03 How It Is Packaged & Priced

COMMERCIAL MODEL

The platform is sold as three products that can be bought individually or together. The navigation in the app is grouped the same way the price list is, so what a customer bought is what they see.

GENERATION

The sales engine. Leads, deals and pipeline, AI prospect research, click-to-dial with call recording and transcription, AI proposals, RFP management and vendor procurement.

FOR COMPANIES THAT WANT TO WIN MORE CONTRACTS

GUARD

Field execution and accountability. Guard roster and compliance, QR and GPS patrol verification, patrol monitoring, incident reporting with evidence, emergency alerts and daily service reports.

FOR COMPANIES THAT MUST PROVE SERVICE DELIVERY

OPERATIONS

Scheduling, workforce management, finance and profitability. Shifts and rostering, timesheets, contracted rate cards, invoicing, dispute handling and financial reporting.

FOR COMPANIES THAT WANT TO STOP RE-KEYING HOURS

ALWAYS INCLUDED

Whatever is bought, every account gets clients, sites, branches, the dashboard, shared documents, notes and activities, integrations, user and role administration, account security and the audit log.

THE SHARED FOUNDATION

The price table

Every package except Generation is priced by **active guard count**, so the price grows with the customer rather than being renegotiated. Generation is a flat $299/month regardless of headcount, because a Generation-only customer may not track guards in the system at all.

Active guards	Generation	Guard	Operations	Complete
1 – 25	$299	$99	$199	$499
26 – 50	$299	$149	$299	$649
51 – 100	$299	$249	$449	$849
101 – 250	$299	$399	$699	$1,199
251 – 500	$299	$599	$999	$1,699
500+	Custom	Custom	Custom	Custom

List prices in USD per month. The 500+ band is quoted by sales rather than sold through self-service checkout. **AegisLead Complete** bundles all three products.

How the guard band is kept honest

The system meters the **active guard count** continuously and bills every guard for the full month they were active in. A background process watches for **band drift** — a customer who has quietly grown past the band they are paying for — and sends a digest to the billing contact rather than silently over- or under-charging.

Trials and comped accounts

AegisLead can grant a **Trial Plan** that unlocks the entire product — all three products, every module — with the AI features switched off. It can also comp any specific package for a fixed window (7, 15, 30 days, a custom period, or lifetime). A comp expires immediately and automatically the moment the tenant buys a paid plan, so nobody ends up holding both.

Search credits — the one metered item

Everything in the subscription is unlimited except work that costs AegisLead money per use: AI generation and external prospect research. These run on a prepaid **credit balance**, bought in one-off packs. Full detail in section 13.

Credit pack	Credits	Price	Typical usage
Starter Pack	3,000	$149	15 full prospect searches, or 200 AI proposal drafts
Pro Pack	13,000	$249	65 full prospect searches, or 866 AI proposal drafts
Elite Pack	23,000	$349	115 full prospect searches, or 1,533 AI proposal drafts

Every new account starts with a free credit balance so the AI features can be tried before anything is purchased.

04 AegisLead Generation

WIN THE WORK

A complete sales system built specifically for security contracts — not a generic CRM. It knows what a guarding proposal looks like, prices it from your own rate cards, and understands that the biggest deals arrive as formal RFPs.

Leads

Capture and qualify prospective customers. The lead page is a **guided, step-by-step workflow** rather than a blank form — it walks a rep from first contact through qualification to a proposal, showing what to do next at each stage.

- **AI lead scoring** — each lead is assessed and ranked so reps work the right ones first.
- **Click-to-dial** — call a lead straight from the record; the call is logged, timed, and the outcome recorded.
- **Automatic call recording** — calls placed through the app are recorded and attached to the lead; recordings from an external phone dialer can also be uploaded and attached.
- **Notes and activities** — a running history on every lead and deal.
- **Import from anywhere** — CSV import with field mapping, so a list from any CRM or spreadsheet loads without reformatting, plus direct connectors to eight CRM platforms.
- **Export** — leads export to CSV for reporting or hand-off.

Deals and pipeline

Qualified leads convert to deals and move through pipeline stages. Deals can be worked in a list or on a **drag-and-drop Kanban board**, where moving a card between columns advances the deal stage.

AI Prospect Search

Type a company name and AegisLead produces a complete **sales playbook** for it: a business summary, the value propositions that apply, concrete sales angles, the personas to approach, and the objections to expect. The result can be imported straight in as a lead.

- **Two modes** — a cheap Preview for a quick look, and a Full search for a complete set of results.
- **Saved searches and history** — every search is kept; reopening a saved search shows the stored result rather than re-running and re-charging it.
- **Shared cache** — if the same company has been researched recently, the cached result is returned instantly and free of charge.
- **Server-side completion** — research jobs can take minutes; the server finishes them even if the user closes the tab, and the result is waiting when they return.

Sales Accelerator

An AI coaching workspace that sits over the pipeline. It is the difference between a CRM that records what happened and one that tells a rep what to do next.

Capability	What it produces
Discovery guide	A tailored question set to take into a first call with this specific prospect.
Live call coaching	Prompts and suggestions generated during the call itself.
Call intelligence	Structured analysis of the discovery call once it is finished — what was learned, what was missed.
Lead and deal scoring	An AI assessment of how likely this is to close, and why.
Outreach plan & follow-up sequences	A drafted multi-step outreach plan and follow-up messages.
Proposal from discovery	Turns the discovery notes straight into a drafted proposal.
Focus queue & alerts	A prioritised daily list of deals needing attention, with the recommended next action.
Forecast & coaching analytics	Pipeline forecast reporting and analysis of how coaching is landing across the team.

Sales Calls

Every call placed from the app, plus any recording uploaded from an external dialer, can be **transcribed automatically** and analysed. Reps get a searchable transcript, structured discovery analysis and coaching feedback. Recordings can be deleted individually when they are no longer needed.

Proposals

AegisLead drafts the security services proposal itself. The draft is priced from the company's own **rate cards**, so the numbers in the document are the numbers that will be invoiced.

- **Versioning** — every revision is kept and comparable.
- **Client comments** — the customer comments directly on the proposal in their portal; the thread stays attached to the document.
- **Approve / reject with a timeline** — the client's decision is recorded with a full timeline of who did what and when.
- **Bulk generation** — draft proposals across many leads at once.
- **PDF export and email delivery** — send it, or hand over a PDF.
- **Placeholder validation** — the system refuses to send a proposal that still contains unfilled placeholder blocks.

RFP management and vendor procurement

The other half of the sales story: when the company needs to subcontract work, it runs a formal procurement from inside AegisLead. This is covered in full in section 9.

05 AegisLead Guard

PROVE THE WORK

Everything needed to put guards on the ground and produce defensible evidence that the service was delivered — the part of the business a client will eventually audit.

Sites

The client locations that need guarding. A site carries its address and geographic coordinates, the client it belongs to, and the branch responsible for it. Sites are the anchor for everything downstream: checkpoints, routes, shifts, incidents and reports all hang off a site.

Guards and compliance

- **Guard roster** — the workforce, with contact details, branch, skills and portal credentials. Guards can be deactivated rather than deleted, so their history stays intact.
- **Duplicate prevention** — the system blocks the same guard being created twice.
- **Guard compliance** — licences, certifications and training with expiry dates and uploaded documents. Status is shown plainly so a scheduler can see at a glance who is current and who is not.
- **Availability** — guards' availability is recorded and used when rostering.

Patrols — checkpoints, routes and verification

This is the heart of the Guard product, and the part that was rebuilt most recently.

Checkpoints

A checkpoint is a physical point on a site a guard must visit — a fire door, a loading bay, a server room. Each one carries a **QR code value** and optionally a **GPS geofence** with a configurable radius (default 50 metres, adjustable from 5 metres to 2 kilometres).

Printable QR sticker sheets

AegisLead generates **print-ready QR sticker sheets** for a site's checkpoints directly from the app. The sheets are laid out for standard label stock — print them, stick them to the physical checkpoints, and the site is live. No proprietary hardware, no NFC tags to source, no per-device licensing.

Routes

Checkpoints are assembled into an **ordered patrol route**. A site can have several routes — a perimeter round, an internal round, a night round.

Dual verification

When a guard reaches a checkpoint they scan its QR code with their phone camera. AegisLead records **two independent verification results**, and stores both:

Check	Possible outcomes recorded
QR verification	Matched · Mismatched (wrong checkpoint scanned) · Not provided · No QR configured
Geofence verification	Inside the fence · Outside the fence · Location unavailable · Invalid location · No geofence configured

Keeping them separate matters: a guard whose phone GPS failed indoors but who scanned the correct QR code is a different situation from a guard who scanned the right code from the car park. The record shows which it was.

Patrol runs

A patrol run is one walk of one route by one guard. The system prevents a guard starting two runs at once, tracks **live location** during the run, and on completion automatically marks any checkpoint that was never scanned as **missed** — no manual reconciliation, and no way to quietly skip a point.

Patrol Monitor

An aggregate live dashboard for supervisors: which patrols are running right now, across which sites, how far through the route each guard is, and which checkpoints have been missed or failed verification.

Incidents

Guards file incident reports from the field. Each report can carry **photo and video evidence** attached directly from the phone.

01
Guard files
Report plus photo or video evidence, from the site.

›

02
Office reviews
A dedicated review queue; approve, amend or reject.

›

03
Client sees
Only approved reports appear in the client portal.

Nothing reaches the client un-reviewed. That one rule is what makes the client portal safe to give out.

Emergency alerts

A **panic button** in the guard app. Pressing it raises an immediate alert that surfaces on the admin dispatch screen and **sends an email to the responsible contacts**. Dispatch acknowledges the alert and then resolves it, and both actions are timestamped — so response time is measurable rather than anecdotal.

Daily service reports

The report the client actually reads. Staff compile a daily service report for a site, **AI writes the summary**, and the report is published to the client portal and **emailed to the client** automatically. This is typically the single most visible deliverable a guarding contract produces, and it is generated rather than typed.

AI guard recommendations

When a shift has an unfilled slot, AegisLead suggests which guards to put in it — based on availability, site familiarity, compliance status and branch — and explains in plain language why each one was suggested.

06 The Guard Mobile Experience

THE PHONE IN THE FIELD

The guard app is the surface the business depends on most and controls least — it runs on the guard's own phone, in the field, and it has to be simple enough to use one-handed at two in the morning.

A shift, start to finish

1. **Sign in.** The guard opens the guard portal on their phone and signs in with credentials the office issued them.
2. **See today's work.** The dashboard shows the shifts assigned to them, with site, times and what still needs doing.
3. **Check in.** One tap on arrival. This starts the shift, moves it to in progress for the office, and begins the clock that will produce the timesheet.
4. **Walk a patrol.** The guard picks one of the site's routes and starts a run. Each checkpoint is scanned with the camera; QR and GPS are verified and recorded.
5. **Complete the run.** Any checkpoint not scanned is automatically marked missed. The run is closed and visible on the Patrol Monitor.
6. **Report anything that happened.** Incidents are filed from the phone with photos or video attached.
7. **Raise an emergency if needed.** The panic button is always available and alerts dispatch immediately.
8. **Check out.** One tap on leaving. This closes the shift and **creates the timesheet** — the single action that connects the field to the invoice.

> **Eight taps, and the office knows everything**
>
> That sequence is the entire guard-facing product. There is no training course, no separate device and no paperwork — and by the time the guard has checked out, the office already holds the attendance record, the verified patrol evidence, the incident report and the timesheet that will be invoiced.

Guard-side guard rails

- **Check-in gates everything.** Patrols cannot be started before the guard has checked in — the sequence is enforced, not suggested.
- **Check-out is validated.** A clock-skew guard prevents a phone with a wrong system time producing a nonsense timesheet.
- **No double-starting.** A guard cannot have two patrol runs open at the same time.
- **Patrol history.** Guards can see their own completed runs.
- **Session handling.** The guard app refreshes its own session so a guard is not thrown out mid-shift.

What the office sees in return

Every guard action lands in the admin app immediately: shift status changes from assigned to in progress to completed; attendance events appear against the shift; patrol runs appear on the monitor with their verification results; incidents arrive in the review queue; and a guard who has not checked in by **fifteen minutes** past their shift start is flagged as a **no-show** on the dashboard — automatically, and the flag clears itself the moment they arrive.

07 AegisLead Operations

SCHEDULE IT, BILL IT

Rostering, hours and money. This is where field activity becomes revenue, and it is the product that removes the most manual re-keying from a guarding business.

Shifts and rostering

Shifts are created against a site with a start, an end and a **required number of guards**. Multi-guard shifts are fully supported: a shift stays open until every required slot is filled, then becomes assigned.

Shift status	Meaning
Open	Fewer guards assigned than the shift requires.
Assigned	Every required slot is filled; nobody has arrived yet.
In progress	At least one assigned guard is currently checked in and on duty.
Completed	Every guard who checked in has checked out — not merely the first one.

A late guard checking in after the others have left correctly flips the shift back to in progress. Status is computed from what actually happened, never stored as a guess.

- **Calendar view** — the roster as a calendar, not only a table.
- **AI guard recommendations** — suggested guards for every open slot, with reasons.
- **No-show detection** — derived live from attendance, with a 15-minute grace period.
- **Shift assignment emails** — guards are emailed when they are put on a shift.
- **Branch scoping** — schedulers see their own branch's roster.

Timesheets

A timesheet is created **automatically when a guard checks out** — one per guard per shift, built from the real check-in and check-out times. Office staff review and **approve** it. Nothing becomes billable without that approval, and nothing has to be typed in from a paper sheet.

Rate cards

The contracted commercial terms per client and site: standard hourly rate, overtime rate and holiday rate. Rate cards are the single source of pricing truth — they price the AI-drafted proposal at the start of the relationship and the invoice at the end of every month, which is what stops the two from disagreeing.

Invoices

01

Generate

Built from approved timesheets at the contracted rates.

02

Issue

Sent to the client and visible in their portal.

03

Settle

Marked paid, cancelled, or disputed and resolved.

Invoices export to **PDF** for sending and **CSV** for the accounts package. Every line traces back to an approved timesheet, which traces back to a guard's verified check-in and check-out.

Invoice disputes

Clients raise a dispute against a specific invoice from their own portal, stating what they disagree with. Staff see the dispute in a queue, respond to it, and resolve it. The whole exchange is recorded against the invoice — so a billing argument has a paper trail instead of living in an email thread.

Finance reporting

- **Finance dashboard** — totals and status breakdown with charts.
- **Outstanding report** — what is owed and how old it is.
- **Payments report** — what has been collected.
- **Disputes report** — what is contested and where it stands.
- **CSV export** — on every report, for the accountant.

Client insurance and compliance

Each client's Certificate of Insurance is tracked, with the document itself stored against the record. The system tracks whether the document is **present or missing**, shows an advisory banner where it is missing, and exposes the status to the client in their own portal so they can fix it themselves. Uploads are validated by file type on the way in.

08 The Client Portal

WHAT YOUR CUSTOMER SEES

A branded, self-service portal for the security company's own customers. It replaces the emailed PDF, the "can you resend that report" phone call, and the invoice query that nobody can find the history of.

Area	What the client can do
Dashboard	A summary of their account — current activity, recent reports and anything awaiting their attention.
Proposals	Read a proposal, comment on specific points, and formally **approve or reject** it. A timeline records every step. The proposal can be exported as a PDF.
Incident reports	Read incident reports that the security company has reviewed and approved — never raw, un-reviewed field reports.
Daily service reports	Read and download published daily reports, including the AI-written summary. These also arrive by email.
Invoices	View every invoice with its full detail, and **raise a dispute** on any of them.
Insurance	See their own Certificate of Insurance status and what is outstanding.
Documents	Download documents the security company has shared with them.
Profile & security	Manage their own profile, set their initial password, change it, and recover it by email with a verification code.

> **Access is controlled by the security company, not self-service.** Client portal users are created by the security company's staff from the client record — there is no public sign-up, so a stranger cannot put themselves inside a paying customer's account. New users set their own password through a one-time secure flow.

Why this sells the product

For a guarding company, the client portal is a competitive weapon rather than a convenience. It changes the monthly conversation from "here is an invoice, trust us" to "here is the invoice, here are the verified patrol records behind every hour on it, and here are the incident reports you have already read." Contract renewals are won on exactly that difference.

09 The Vendor Portal & Procurement

SUBCONTRACTING, RUN PROPERLY

When a contract needs capacity the company does not have — another city, a specialist skill, a short-term surge — AegisLead runs the whole subcontractor procurement as a formal process rather than three phone calls and a forwarded email.

The procurement flow

1. **Draft the RFP.** Create a Request for Proposal, or have **AI generate the whole document** from a brief.
2. **Analyse the requirements.** AI reviews the security requirements in the RFP and flags what the document actually demands of a bidder.
3. **Invite vendors.** Select vendors from the directory. Each receives an **emailed, single-use secure link** — no account to create, no password to forget.
4. **Collect bids.** Vendors open their link, see only their own RFP, and submit a priced proposal with supporting documents. Access closes at the due date.
5. **Evaluate with AI.** AegisLead produces a structured **evaluation report** comparing every bid on the same criteria — so the decision is comparable, not impressionistic.
6. **Award or reject.** Award the contract to the winner and reject the rest. Both outcomes send the vendor an automatic email, and both are written to the audit log.
7. **Track performance.** The awarded vendor gets performance reviews recorded against them, building a history for the next procurement round.

Related capabilities

- **Generate a proposal from an RFP** — when the company is the one bidding, AegisLead turns an incoming RFP into a drafted response.
- **Dual logos** — RFP documents carry both the issuing company's and the recipient's branding.
- **Vendor directory** — a managed list of subcontractors with their details and performance history.

Security of the vendor link

The vendor portal has no login at all. Access is gated by a cryptographically random, single-purpose invitation token that opens exactly one RFP and expires at that RFP's due date. A vendor cannot see another vendor's bid, the other invitees, or anything else in the system.

10 The AI Layer

WHERE THE AI ACTUALLY WORKS

AI in AegisLead is not a chat window. It is embedded at the specific points where a human would otherwise spend an hour on a blank page, and every use is metered so a customer can see exactly what it costs.

Every AI capability, and what it costs

Costs are in credits. A light task costs 5, a standard generation 15, and a heavy document or transcription 40. Live call coaching is 1 per prompt, because it fires repeatedly during a call.

Capability	What it does	Credits
Proposal draft	Writes a full security-services proposal, priced from your rate cards	15
Proposal from discovery	Turns discovery-call notes directly into a draft proposal	15
RFP generation	Writes a complete Request for Proposal from a brief	40
Security RFP analysis	Analyses the security requirements inside an RFP	40
Proposal from RFP	Drafts a bid response to an incoming RFP	40
Evaluation report	Compares every vendor bid against the same criteria	40
Call transcription	Transcribes a recorded sales call	40
Discovery guide	Builds a tailored question set for a specific prospect	15
Discovery call intelligence	Structured analysis of what the call revealed	15
Live call coach	Real-time prompts during a live call	1
Sales assessment	Scores and explains a lead or deal	15
Lead generation	Generates qualified lead candidates	15
Outreach plan	Drafts a multi-step outreach sequence	15
Business insight recommendations	Recommended actions from account activity	15
Revenue intelligence & financial recommendations	Revenue summaries and financial guidance	15
Daily report summary	Writes the summary on the client's daily service report	5
Incident risk summary	Summarises the risk profile of an incident	5
Guard recommendation explanation	Explains in plain language why a guard was suggested for a shift	5
Email draft	Drafts an outbound email	5
Note summary	Condenses a long note thread	5

Capability	What it does	Credits
Lead extraction	Pulls structured lead data out of unstructured text	5
Prospect company insight	Company-level insight attached to a prospect	5

Prospect research pricing

Research type	What you get	Credits
Company playbook	A full sales playbook for one named company	50
Preview discovery search	A quick look — up to 5 prospects	50
Full discovery search	A complete prospect discovery run	200

Discovery is priced per search, not per result, so the price is known before the button is pressed. A search that fails is refunded in full; a cached result costs nothing.

How the AI is governed

- **Safety screening** — AI output is screened for personal data and unsafe language before anything is marked client-visible.
- **Full generation logging** — every AI call is logged with what it cost, so a customer's AI spend is answerable and the pricing can be tuned from measured data rather than guesswork.
- **Prompt versioning** — prompts are versioned centrally, so behaviour can be improved without redeploying the application.
- **Graceful degradation** — most AI features have a deterministic fallback if the AI provider is unavailable, so the app keeps working rather than erroring.
- **Entitlement enforcement** — AI is only available to plans that include it, and that is enforced on every route into the system, not only the web app.

> **A single AI engine.** AegisLead consolidated onto one AI provider — including call transcription, which previously required a second vendor and a second API key. One key now powers every AI feature in the product, which simplifies both operation and cost control. External company research runs on a dedicated research provider.

11 Users, Roles & Account Security

WHO CAN DO WHAT

Permissions are job-shaped. A non-technical owner picks a role from a short list and gets a sensible result, without reading a permission matrix — but a company that wants fine control can build custom roles from individual permission keys.

The eight built-in roles

Role	What they see
Super Admin	The account owner. Everything, including billing, users, branches, integrations, branding and the audit log. The only role with account administration.
Manager	Runs the day-to-day business across sales, field operations and invoicing. Cannot change billing, users, branches or integrations.
Sales	The Generation product only — leads, deals, calls, proposals, RFPs and vendors.
Operations	Scheduling and field operations — sites, guards, shifts, patrols, incidents and reports.
Supervisor	Deliberately narrow: watches patrols and reviews what is flagged, without touching the roster or any financial data.
Finance	Timesheets, rate cards, invoices, disputes and financial reporting. Does not see the AI sales tools or branches.
Guard	The guard mobile portal only.
Client	The client portal only.

Beyond these, **custom roles** can be assembled from a catalogue of roughly 100 fine-grained permission keys across 30 functional areas. A safeguard prevents anyone granting a permission they do not themselves hold, so a role cannot be used to quietly escalate privileges.

Owner protection

The account owner is protected at the system level — they cannot be deleted, demoted or locked out by another administrator, and an administrator cannot remove their own access and strand the account.

Account security

Two-step verification

Email-based two-factor authentication, enabled and disabled by the user themselves from their own security settings with a verification step at each end.

Recovery email

A separate, verified recovery address so a user who loses access to their primary inbox is not locked out permanently.

Security alert emails

The account is notified by email when sensitive security settings change, so an unauthorised change is visible immediately.

One active session

Each user is limited to a single active login — the newest wins. A shared password becomes obvious instantly, and the displaced session is told clearly why it ended rather than failing silently.

Audit trail

Security-sensitive actions are written to a tenant-scoped audit log: logins, role changes, forced logouts, denied access to restricted fields, and contract awards and rejections. It is readable from the admin app by anyone with audit permission.

Field-level permissions

A further layer can hide or lock specific sensitive fields — a guard's pay rate, a client's billing notes — from roles that should not see them, even on a record they otherwise have access to. Enforcement runs on every request.

Branches

Companies operating in several regions model those as branches. Staff, sites, guards and shifts belong to a branch, and non-owner staff are scoped to their own — so a regional manager sees their region, and only their region.

12 Integrations & Open API

CONNECTING TO EVERYTHING ELSE

AegisLead is not a closed box. Existing CRM data comes in, platform events go out, and anything the interface does can be done programmatically.

CRM connectors

Import contacts and leads directly from eight CRM platforms. Where a provider supports it, the connection is made by secure OAuth and the stored credentials are encrypted at rest.

Supported platforms
HubSpot · Salesforce · Pipedrive · Zoho · GoHighLevel · Close · Copper · Freshsales

Universal CSV import

For anything not on that list, leads import from a CSV with **field mapping** — the user matches their spreadsheet's columns to AegisLead's fields on screen, so a list from any system loads without being reformatted first.

Outbound webhooks

AegisLead notifies other systems the moment something happens. Every outbound payload is cryptographically signed so the receiver can verify it genuinely came from AegisLead, and every delivery attempt is logged.

Event	Fires when
client.created	A new client is added
guard.created	A new guard joins the roster
shift.created / updated / deleted	The roster changes
shift.assigned	A guard is put on a shift
incident.created	A guard files an incident
incident.approved	An incident is approved and becomes client-visible
invoice.generated	An invoice is raised
invoice.paid	An invoice is settled

Public API and API keys

- **API keys** — generated in the app, shown once, and stored only as a hash. A leaked database does not leak usable keys.
- **Scoped permissions** — each key is limited to exactly what it needs.

- **Per-key rate limiting** — one integration cannot affect anyone else.
- **Full request logging** — every API call is recorded.
- **Entitlement enforcement** — the API respects the plan, so a module that was not purchased is not reachable through the back door.
- **Public documentation** — a developer documentation page is published with the product.

Email delivery

AegisLead sends on the order of sixteen distinct notification types, all delivered over a transactional email service rather than raw SMTP — including proposal delivery, daily service reports, shift assignments, emergency alerts, vendor invitations and contract awards, verification and password-reset codes, security alerts, credit balance warnings and billing digests.

Shared documents and branding

- **Shared documents** — share files with a client through their portal, with controlled access.
- **Branding** — the product carries AegisLead branding consistently across the admin app, guard portal, client portal and every email and PDF it generates.
- **Support chat** — a live support chat widget is embedded across the application, loaded only after the page is idle so it never slows the app down.

13 Billing, Credits & Self-Service

GETTING PAID

AegisLead sells itself. A customer can sign up, choose a package, pay by card and be provisioned without anyone at AegisLead touching the account.

Subscriptions

1. **Choose a package and band.** The plan page shows exactly what is included and what it costs at the customer's current guard count.
2. **Pay by card.** Checkout runs through Stripe; AegisLead never touches card details.
3. **Get provisioned automatically.** The subscription confirmation unlocks exactly the modules that were paid for — resolved from the purchased price itself, never from editable metadata.
4. **Manage it themselves.** Customers update their card, view invoices and manage the subscription through a self-service billing portal.

Entitlements

What a customer paid for is enforced everywhere — the web app, the public API and every background process. The sidebar, the command palette and the API all agree, so a module that was not bought is not visible and not reachable. Attempting to use a feature outside the plan returns a clear, distinct response that lets the interface offer an upgrade rather than show an error.

How the credit system works

Reserve, then settle

A job's true cost is not known until it finishes. The system holds the maximum up front, then charges the actual amount and returns the rest. A failed job is refunded in full; a cached result costs nothing.

An append-only ledger

Every credit movement is a permanent ledger row. Corrections are new rows, never edits, and the ledger total must always equal the balance. A customer can see exactly where every credit went.

Low-balance warnings

Billing contacts are emailed before credits run out, rather than discovering it when a search fails.

Automatic top-up

Customers can opt in to have a pack purchased automatically when the balance runs low — and control the thresholds themselves. Entirely optional.

Abandoned holds released

A hold left behind by a closed tab or a restart is swept automatically after an hour, so credits can never be frozen permanently.

Refund and chargeback handling

Credits are clawed back automatically on a refund or chargeback, so a customer cannot buy, spend, refund and keep the usage. Partial refunds are escalated to a human rather than guessed at.

What the customer sees

- **Your Plan** — current package, guard band, what is included, and what an upgrade would cost.
- **Search Credits** — balance, the full ledger of what was spent on what, pack purchase and auto top-up settings.
- **Billing** — card management, invoices and subscription controls.

14 The Platform Admin Console

A separate internal console, used only by the AegisLead team, for running the business side of the platform. It is a completely separate identity from any customer account.

What it shows

Tenants	Paying	On trial	Credits out	AI cost
EVERY CUSTOMER ACCOUNT	LIVE SUBSCRIPTIONS	TRIALS AND COMPS	OUTSTANDING BALANCES	30-DAY SPEND

- **Tenant management** — view every customer account, its plan, its usage and its state; and permanently delete an account when asked to.
- **Comp and trial grants** — grant any package, or the full Trial Plan, for 7, 15 or 30 days, a custom period, or lifetime — and revoke it.
- **Accurate plan reporting** — an unpaid self-signup is never counted as a paying customer, and the comped plan is recorded explicitly rather than inferred.
- **AI usage and cost monitoring** — what AI is costing per tenant and across the platform.
- **Credit recharge monitoring** — who is topping up and how often.
- **New signup alerts** — an internal email on every new signup.

Separation of duties

The platform console was deliberately detached from customer accounts: it has its own credentials and its own authentication entirely. No customer administrator, however senior within their own company, has any path into it — and platform staff do not hold customer logins.

15 Architecture, Security & Reliability

The stack

Layer	Technology
Front end	Next.js with React and TypeScript. One application serves all four experiences, separated by route.
Back end	NestJS with TypeScript — around seventy feature modules, each with the same consistent structure.
Database	PostgreSQL, accessed through the Prisma ORM, with versioned migrations.
File storage	Backblaze B2 object storage — evidence photos, compliance documents, call recordings and logos live off the application host.
Payments	Stripe for subscriptions and one-off credit purchases.
Email	A transactional email API rather than SMTP, for deliverability.
Hosting	Containerised deployment to a dedicated production server, with a separate staging environment.

Security measures in place

- **Tenant isolation** — every query is scoped to the owning tenant, enforced throughout the application.
- **Token-based authentication** with separate token types for admin, client and guard, and tracked sessions.
- **Role-based access control** on every administrative route, with self-escalation prevented.
- **Hashed API keys** — the plaintext is shown once and never stored.
- **Signed webhooks** — every outbound payload is cryptographically signed.
- **Encrypted third-party credentials** — connector tokens are encrypted at rest.
- **Outbound request protection** — customer-supplied webhook URLs are validated to prevent them being used to reach internal systems.
- **Upload validation** — uploaded documents are checked by file type on the way in.
- **Single active session per user**, with a clear message when a session is superseded.
- **Email two-step verification**, verified recovery addresses, and security alert emails.
- **Audit logging** of security-sensitive actions.

Reliability

- **Encrypted nightly database backups** held off-site in separate object storage.
- **Automated uptime monitoring** with health probes on every deployment.
- **Continuous integration** — the full test suite runs on every change before it can ship.
- **Separate staging environment** configured identically to production.
- **Shared caching and rate limiting** across application instances, so the platform scales horizontally without duplicated work or duplicated charges.

Performance

A dedicated performance pass removed the heaviest costs in the application: the dashboard no longer loads every lead, deal and proposal in order to render a handful of summary lines; an unused animation library was removed entirely; and the support chat widget is held back until the page is idle so it cannot delay the first view.

16 What Changed in the Last Two Months

SEPTEMBER – NOVEMBER 2026

The platform moved from a feature-complete application to a commercially operable product in this period. These are the changes a returning viewer would notice.

It became a product you can buy

- Full **Stripe checkout and automatic provisioning** — a customer can subscribe and be set up without manual intervention.
- The published **AegisLead price table** implemented in full: four packages across six guard bands, with active-guard metering and automatic band-drift detection.
- **Per-service entitlements**, so Generation, Guard and Operations can be sold separately and are enforced on every route in.
- **Credit packs**, low-balance warnings, opt-in automatic top-up, and full refund and chargeback handling.
- **AI metering** — every AI call now records what it cost, and AI that was previously running free is charged for.
- A **Trial Plan** giving the full product minus AI, plus flexible comped plans.

The Guard product was rebuilt

- **QR checkpoint verification** — scan-to-verify at every checkpoint, recorded independently of GPS.
- **Printable QR sticker sheets** generated from the app — no special hardware to buy.
- **Guard tour hardening** — automatic detection of missed checkpoints, double-start prevention, clearer run status.
- **The shift workflow made usable end to end** — genuine multi-guard shifts, correct status across several guards, automatic no-show detection with a grace period, and a connected path from site to shift to patrol to timesheet.
- **Patrol Monitor** — a live aggregate view of every patrol in progress.
- **Shift calendar view** and shift assignment emails to guards.
- **Emergency alert emails** to the responsible contacts, not just an on-screen notification.

The sales product got sharper

- **Click-to-dial with automatic call recording**, plus the ability to attach recordings from an external dialer.
- **Call transcription consolidated onto a single AI provider**, removing a second vendor and a second API key.
- **Six further CRM connectors** added alongside HubSpot and GoHighLevel — eight in total.
- **Field-mapped CSV import** for leads from any system at all.
- **Prospect Search reliability** — results are no longer lost if the user navigates away, saved searches reopen stored results rather than re-charging, and the cache is shared across servers.
- **A guided, step-by-step lead workflow** replacing the blank-form page.
- **Proposals priced from rate cards**, so the quoted number and the invoiced number are the same number.

Security and account control

- **Email two-step verification, verified recovery email and security alert emails.**
- **One active login per user**, newest wins, with a clear explanation on the displaced session.
- **Platform Admin fully separated** from customer accounts, with its own credentials.
- **Account owner protection** — owners cannot be deleted or demoted, and administrators cannot lock themselves out.
- **A security hardening pass** — an authentication bypass in email verification closed, outbound request protection against customer-supplied URLs, dependency vulnerabilities patched, a published credential fallback removed, and client self-signup removed so strangers cannot land inside a paying account.
- **A rebuilt role set** — eight job-shaped roles replacing a broader, more confusing set, with a deliberately narrow Supervisor role reinstated.

Operations and polish

- **Production infrastructure** — containerised deployment pipeline, health probes, uptime monitoring, encrypted nightly off-site database backups, and object storage for all uploaded files.
- **Daily service reports emailed to clients** with an AI-written summary.
- **A sustained UI consistency programme** — design-system primitives, accessibility refinements, consistent DD-MM-YYYY dates, friendly error messages in place of raw diagnostics, table and form fixes, and a measured performance pass.
- **Client insurance tracking simplified** to document present or missing, which is what the business actually acts on.

17 Suggested Video Walkthrough

A RUNNING ORDER

A proposed structure for the explainer video. It follows one contract from first contact to paid invoice, because that single chain demonstrates every product at once and needs no narration to explain why the parts belong together.

#	Scene	What to show on screen
1	**The problem**	No screen. State the stack a guarding company runs today — CRM, scheduler, guard-tour app, accounts package, spreadsheets — and that nothing connects.
2	**The dashboard**	Open the admin app. The overview: today's shifts, no-shows, pipeline, recent activity. Establish that this is one system.
3	**Find the prospect**	Prospect Search. Type a company name, show the generated playbook — summary, value props, angles, personas, objections — and import it as a lead in one click.
4	**Work the lead**	The guided lead workflow. Click to dial, the call recording appearing on the record, the AI transcript and the coaching analysis.
5	**Move the deal**	The Kanban board. Drag a card between stages.
6	**Draft the proposal**	Generate the proposal with AI. Highlight that the pricing comes from the company's own rate cards.
7	**Client approves it**	**Switch to the client portal.** The client reads the proposal, leaves a comment, approves it. This hand-off is the most important cut in the video.
8	**Set up the site**	Create the site. Create checkpoints. **Print the QR sticker sheet** — a strong visual: software producing something physical.
9	**Build the route**	Assemble checkpoints into an ordered patrol route.
10	**Roster the shift**	Create a shift needing two guards. Show the AI guard recommendation and its explanation. Assign.
11	**The guard arrives**	**Switch to a phone.** Guard signs in, sees the shift, checks in. Cut back to the admin screen showing the shift flip to *in progress*.
12	**The patrol**	On the phone: start the run, walk up to a checkpoint, scan the QR sticker from scene 8. Show both verifications confirming.
13	**Something happens**	File an incident with a photo. Optionally show the panic button and the alert landing on the dispatch screen.
14	**Supervision**	The Patrol Monitor, live — who is patrolling where, and what has been missed.

#	Scene	What to show on screen
15	**Check out**	The guard checks out. Cut to the **timesheet that was just created automatically**. Approve it.
16	**Review and publish**	Approve the incident report. Publish the daily service report with its AI summary.
17	**Invoice**	Generate the invoice from approved timesheets. Issue it. Show the PDF.
18	**Close the loop**	**Back to the client portal.** The client sees the invoice, the incident report they have already read, and the daily reports. State plainly: every hour on this invoice is backed by a verified scan.
19	**Subcontracting**	Short segment: create an RFP with AI, invite vendors, show the AI bid comparison, award the contract.
20	**Control**	Fast montage — roles, two-factor authentication, audit log, integrations, webhooks, plan and credits.
21	**Close**	The three products and the price table. One line: one platform, from the first call to the paid invoice.

Three moments to protect in the edit

Scene 7 — the client approving a proposal in their own portal proves this is not just internal software. **Scene 12** — scanning a sticker the software printed four scenes earlier closes a loop the viewer can see. **Scene 15** — a timesheet creating itself from a guard's check-out is the moment the audience understands why the parts belong in one system.

> **Practical note for the shoot.** A demonstration account with realistic seeded data — clients, sites, guards, shifts, patrol history, invoices — exists and should be used rather than an empty account. Several screens are considerably less convincing when empty.

18 Known Limits & Roadmap

STATED HONESTLY

Included so that nothing in the video over-claims. None of these affect the workflows described above; they are either deliberate scope decisions or acknowledged next steps.

Deliberately out of scope

Not built	Why
Recurring / template shifts	Confirmed with the owner: shifts are created ad hoc, one at a time. Recurring rosters were explicitly not wanted.
Scheduled patrols	Guards walk a route when they choose. "Patrol missed" as a concept applies only to checkpoints inside a started patrol, which is detected automatically.
Guard self-onboarding	By design, an administrator sets the guard's portal password on the guard form and hands it over.
Tenant re-branding	Removed deliberately so the product cannot be restyled away from AegisLead.
Client self-signup	Removed for security — it allowed strangers to place themselves inside a paying account.

Acknowledged next steps

- **Visual unification across portals** — the admin app, client portal and guard portal have each had a design pass, but a single shared visual language across all three is still in progress.
- **Prospect Search list polish** — pagination, bulk actions and a persistent filter sidebar.
- **Custom domains** — ownership verification exists; automatic certificate issuance and routing do not.
- **Audit log search** — the log is readable but has no filtering or search yet.
- **Credit pack economics** — pack sizes and prices are set, but the true upstream cost per research job is still being measured from live usage before the margin is confirmed.

AegisLead — Complete Platform Overview. Prepared 11 November 2026 against the production build. Every capability described in sections 1 to 15 is implemented and shipped. Figures in section 3 are the published list prices; Stripe remains the source of truth for what is actually charged.
